European EF Proficiency Dashboard

This dashboard explores relative English proficiency disparities across European countries by combining educational exposure indicators with EF English proficiency measures.

The analysis focuses on the concept of *relative proficiency gap*, defined as the difference between observed English proficiency performance and expected outcomes based on learning exposure indicators.

A temporal lag alignment strategy was applied during preprocessing to better account for delayed effects between educational exposure and measured proficiency outcomes.

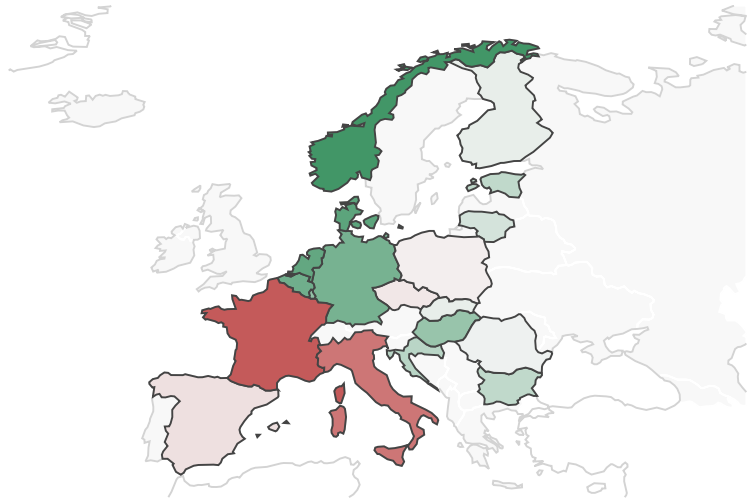

Results should be interpreted cautiously due to differences in data availability, country coverage, and the exploratory nature of the analytical framework.

Countries	Average gap	Selected year
20	0.192	2020

European spatial distribution

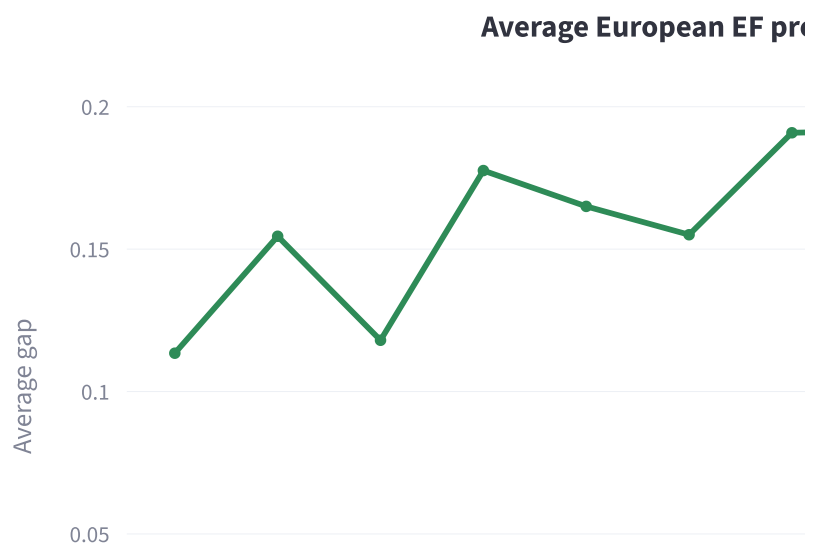

Relative EF proficiency gaps across European countries for the selected year.

undefined

European temporal evolution

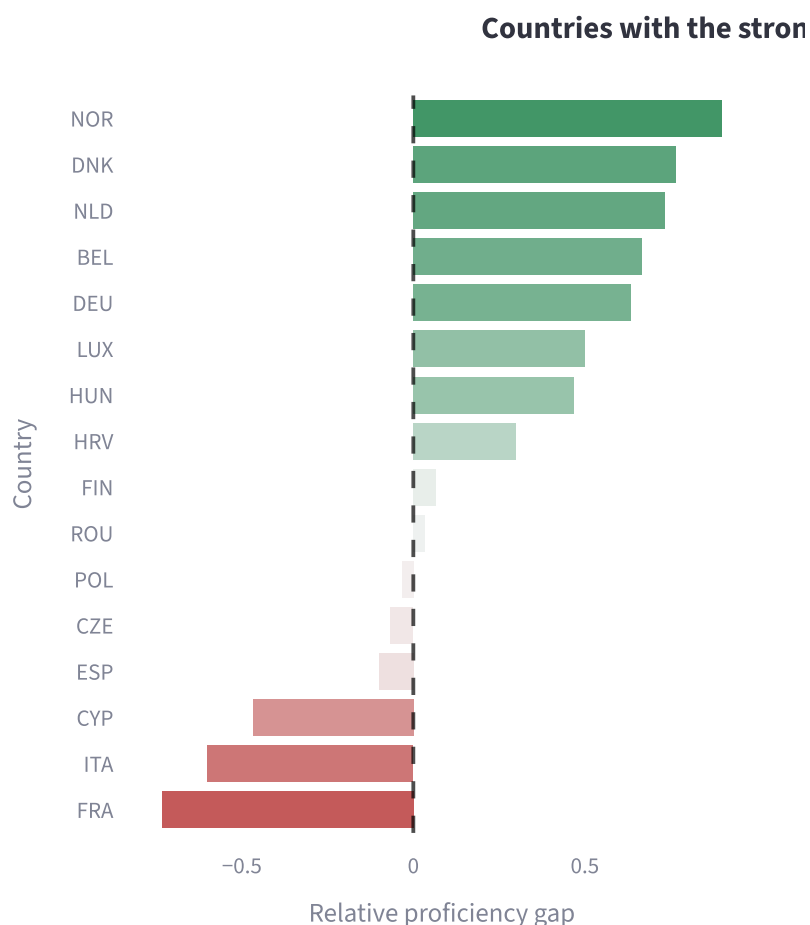

Average relative EF proficiency gap across Europe over time.

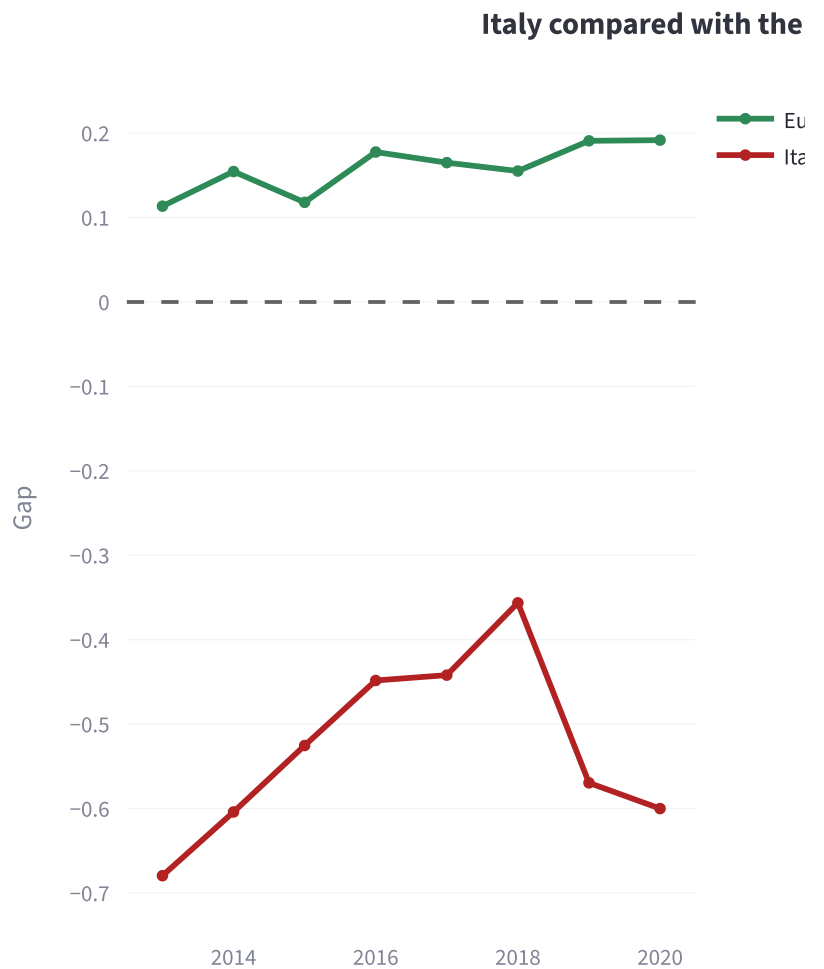

Country performance comparison

Comparison of the strongest positive and negative relative EF proficiency gaps across Europe.

Italy compared with the European average

Comparison between Italy and the European average relative EF proficiency gap across time.
